

## How to use AR Dam

This application requires an Android device. Download the application and manually install it in the device. Download and print the augmented reality marker.

Start the application in the device, hold it vertically and choose the dam model from the list.

Point the device camera to the printed marker and then rotate the device horizontally. If everything is working correctly an image should be seen on the device superposed onto the marker.

At the top of the image a brief explanation is given of the current step of the experiment.

At the bottom of the image four different buttons are displayed. The "Translate" button is used to adjust the image position. The "Scale" button increases/decreases the image size. The "Next Image" button cycles through a series of images to display the progress of the experiment. The "Switch Language" button is used to switch the top text between Portuguese and English.
